

AI-POWERED PHISHING EMAIL DETECTOR

Project Overview

The AI-Powered Phishing Email Detector is a cybersecurity-focused web application that uses Google's Gemini AI model to analyze email content and identify potential phishing attacks. The system helps users detect suspicious emails and provides risk assessments along with security recommendations.

Objective

- Detect phishing emails using Artificial Intelligence.
- Improve cybersecurity awareness.
- Provide risk analysis and security recommendations.
- Demonstrate the use of Generative AI in cybersecurity applications.

Technologies Used

- Python
- Streamlit
- Google Gemini AI
- GitHub

Features

- Phishing Email Detection
- Risk Score Generation
- Threat Level Analysis
- AI-Based Recommendations
- Interactive User Interface

System Workflow

User Input

Streamlit Interface

Gemini AI Analysis

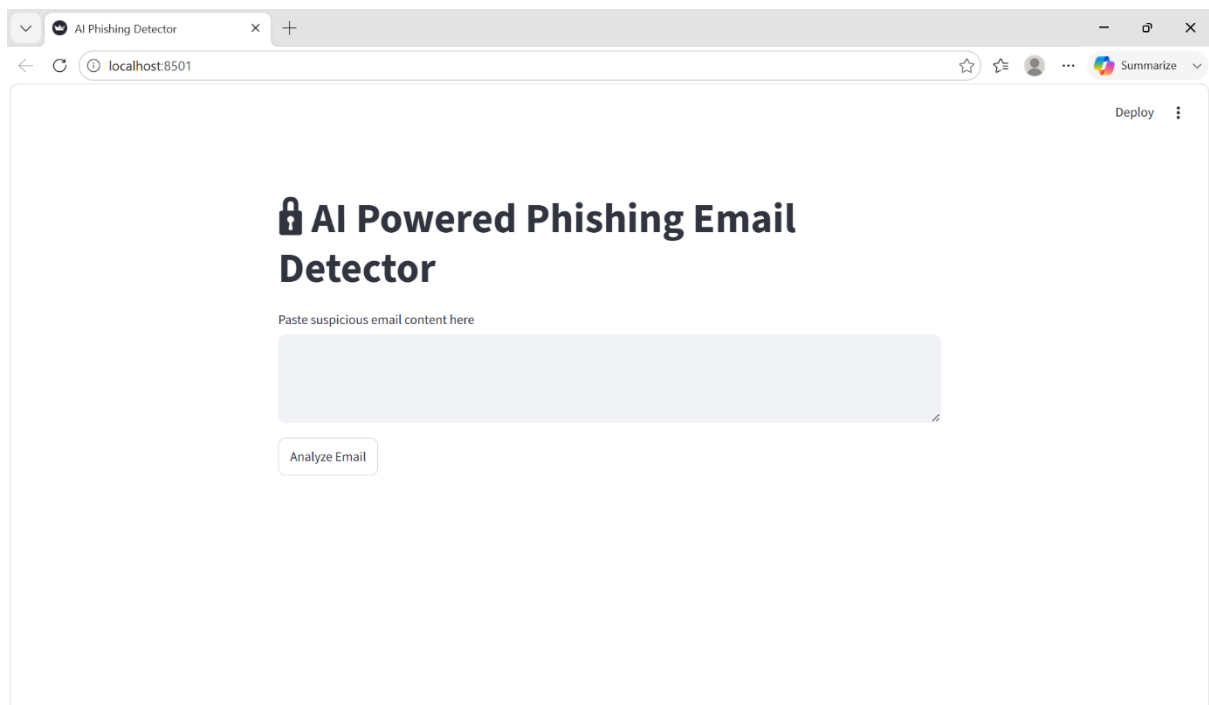

Threat Detection

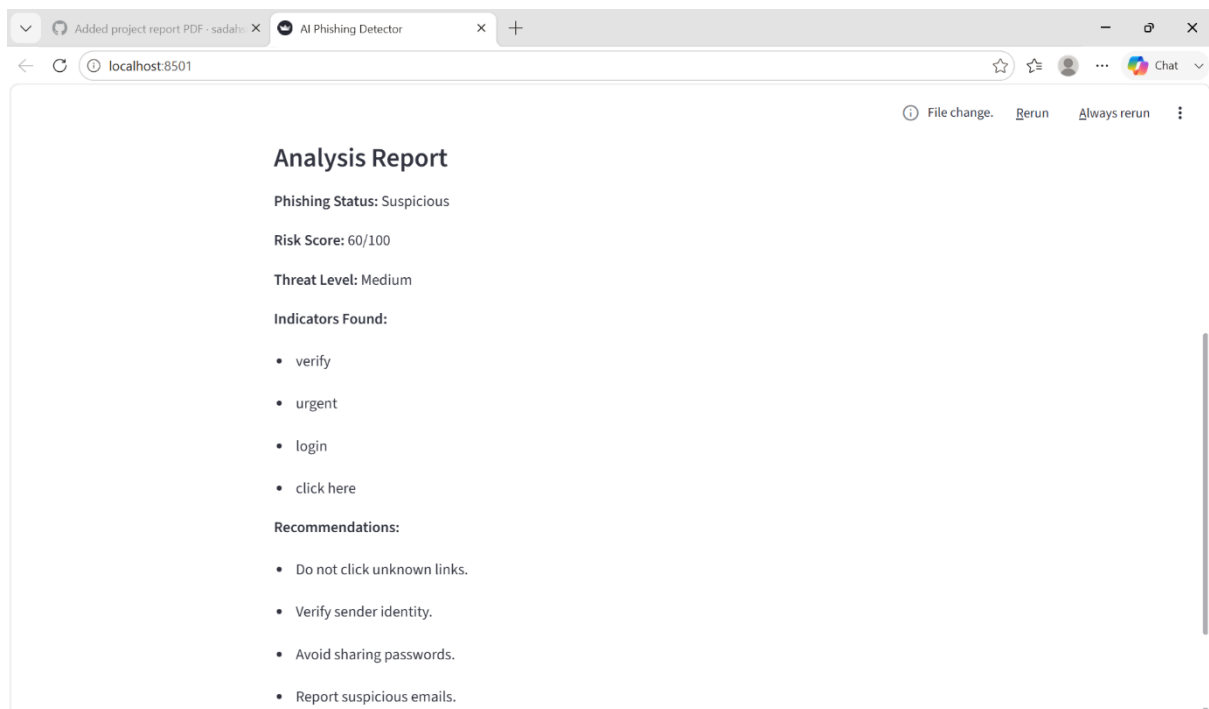

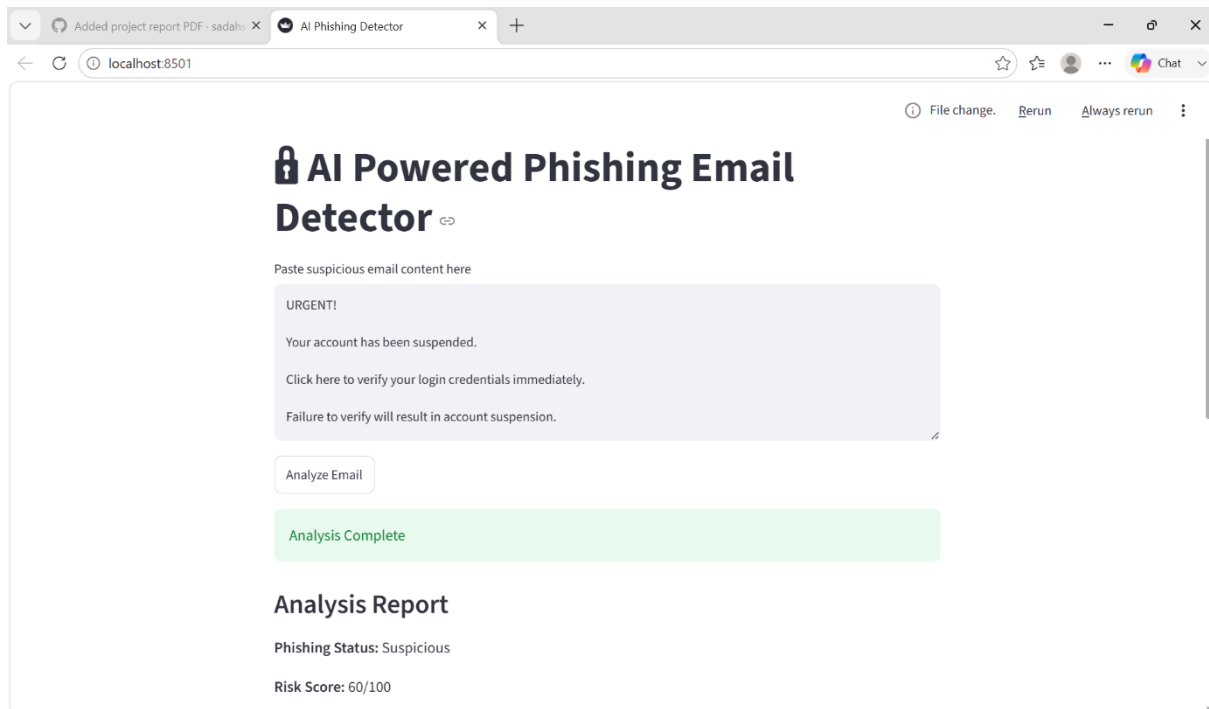

Risk Assessment

Security Recommendations

Future Enhancements

- URL Scanning
- Email Header Analysis
- Malware Detection

- Real-Time Threat Intelligence
- Attachment Security Analysis
